

Problem 275: Last But Not Least

Difficulty: Easy

Problem Background

You and your friends are competing in a fun text challenge. Given a bunch of different strings you have to figure out the last letter of a given word or sentence as quickly as possible. Since you are a slow reader, you decide to write a program that instantly calculates the last letter of a string for you.

Problem Description

Write a program that takes in many different strings and identifies the last letter of each string. In this case, the strings will only contain uppercase and lowercase letters and spaces, and not any other characters or symbols, aside from a set of double quotes that contain the string. If the string is empty or contains only spaces, then “No Letter Found” should be printed instead.

Sample Input

The first line of your program’s input, **received from the standard input channel**, will contain a positive integer representing the number of test cases. Each test case will include a string wrapped in double quotes and containing only letters and spaces.

```
5
"This is a message"
"Hello"
" "
"Text"
"FUN"
```

Sample Output

For each test case, your program must print a single line containing the last letter of the string or “No Letter Found” if there are no letters in the provided string:

```
e
o
No Letter Found
t
N
```
